

Main page for navigation.  
includes routes for bikes or walking. Also includes map view.  
you can access profile + settings.

Map that can show hazards  
+ report them.

People can report hazards  
+ post reviews on their route.

they can delete if the issue  
is fixed.

Verification process is placed  
to stop false reports.

The user creates an account and is taken to the dashboard. The dashboard allows them to check their reviews, check for nearby parking rails, nearby accessible buildings, settings, places they've bookmarked, and buildings/routes they've submitted as accessible.

If the user chooses one of the first two buttons, the app takes them to a map where they can enter their destination. The user is able to filter their search based on the quickest routes, if they don't want any hills, and if they're open parking rails available.

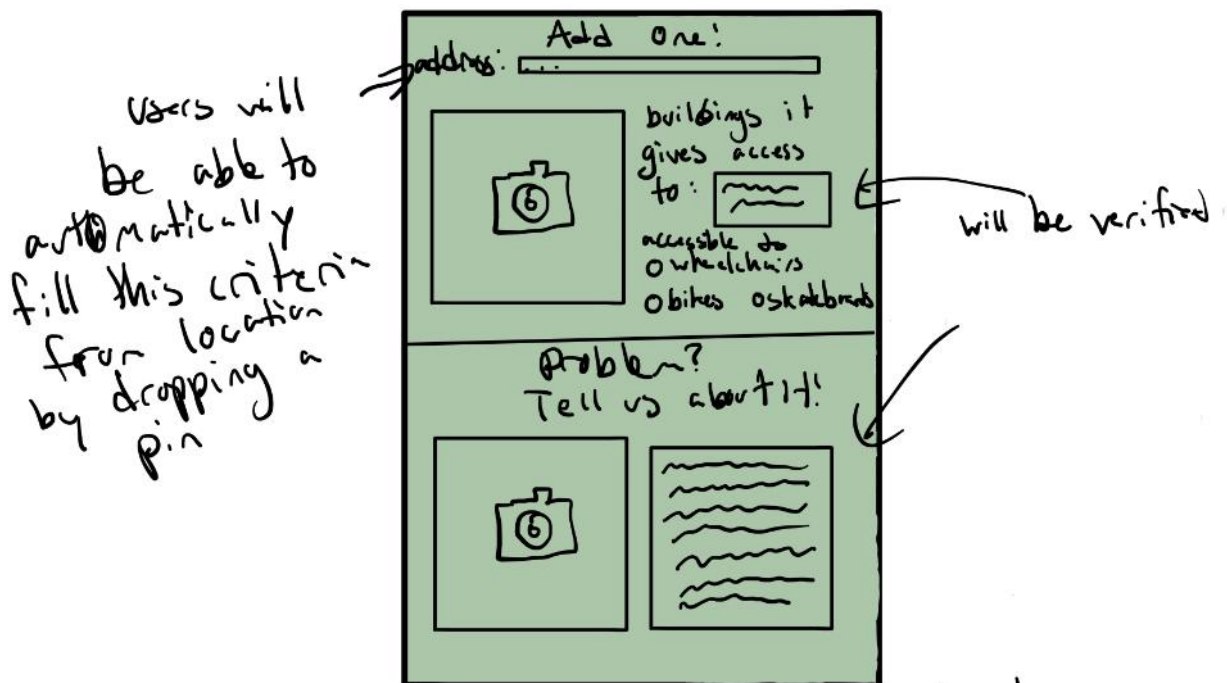

Once the user filter's their search, the routes are filtered based off the user's input. The user is able to click the button to use this route or they can check reviews of the route.

initial screen for new users:  
select type of vehicle so  
app can filter what kind of  
ramps/locations should be highlighted

Google Maps inspired  
GPS system with ramps  
highlighted

users are able to alert  
app of new, accessible routes  
or if a route is no longer fit  
for use

Maps View:  
similar to  
google maps.  
highlights  
ramps/walkways

Home page: user can  
view routes if they are  
riding or walking. can  
also use map to set start/end location

Users can submit  
problems with the routes  
as well as report  
problems others might  
face. can be "upvoted"  
to increase confidence  
in user that it is  
accurate.
